77

 77 AV
Processor/Amplifier

Available in Carbon or Nextel

The Quad 77 AV Processor's automatic set-up combined with a Quad System Console make for truly fuss-free home theatre.

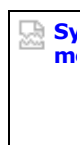

AV Processor Amplifier

The Quad 77 AV can be used alone, with the 77 pre-amplifier, or with the 77 integrated amplifier. Abundant features, perfect integration with our System console, and an inbuilt communications bus, mean that it can control a basic, starter-level surround sound system or a full videophile array with multiple power amplifiers with equal ease.

Amongst its wealth of features, the 77 includes twenty-five presets to store level settings for individual channels and mode. There are nine modes: three Dolby Pro Logic; two Dolby 3; and four effects modes for non-Dolby material. All basic functions — source, display on/off, bypass, balance, volume, stand-by — are accessible from the elegant fascia panel, while other settings fall under the control of the Quad System Console.

The 77 AV uses the analogue devices SSM21 25 Pro Logic decoder chip and incorporates a 70W centre channel power amplifier. It provides three auxiliary inputs and has a sub-woofer output with switchable high-pass filter for front left and right speakers. Set-up is automatic using a microphone and in-built noise source.

Dolby, the Double-D symbol and Dolby Pro-Logic are trademarks of Dolby Laboratories Licensing Corporation.
